

Digital Literacy Report

Title Page

- Name: Vaishnavi Upadhyay
- Reg No.:25BAI11583
- Branch: B.Tech CSE AIML
- Year: 1st Year
- Course Code: CSE0001

Introduction

This project is about understanding digital literacy and how students can use technology safely and effectively. While doing this project, I learned how to create visual content, practice basic coding, set up professional profiles, design quizzes, and understand online threats. Before this, I mostly used digital tools casually, but this project made me realize how important it is to use them properly. It also helped me think about how I present myself online and how I communicate with others. I understood that digital literacy is not just about using apps, but also about being responsible and aware. Overall, this project helped me improve my technical skills and made me more careful about my online activities.

Task 1 – Digital Literacy Awareness Infographic

For Task 1, I used Canva to create a one page infographic about digital literacy. I included topics like meaning of digital literacy, useful tools, online safety, professional presence, and email etiquette. At first, I tried adding too much information, and the design looked very crowded. I had to redo it 2–3 times to make it simple and clean. I used icons and short points so that it is easy to understand quickly. I also mentioned tools like Google Docs, GitHub, HackerRank, and Canva which students can use. Choosing colours and fonts was a bit confusing in the beginning, but after experimenting, I got a better result. This task helped me understand how to present information visually instead of writing long paragraphs. I think my infographic can help others quickly understand the importance of digital literacy.

Task 2 – Student Digital Portfolio

In Task 2, I created and updated my GitHub and LinkedIn profiles. On GitHub, I added a profile README with my basic details like name, branch, and a short introduction. Initially, I was not sure what to write in the bio, but after some thinking, I kept it simple and clear. On LinkedIn, I filled in my education details and wrote a headline: “1st Year B.Tech CSE AIML student exploring AI/ML.” This task made me realize that even as a beginner, having an online presence is important. These platforms can help me show my work, connect with others, and find opportunities. In the future, I plan to upload my projects regularly on GitHub and update LinkedIn with my achievements. This task taught me how to present myself professionally online.

Task 3 – Coding & Collaboration Platforms

For Task 3, I worked on both coding practice and collaboration tools. I created a HackerRank account and solved the “Hello World!” problem in Python. At first, I was a little confused about input and output, but after trying once or twice, I understood the logic. It felt good to solve it on my own. I also created a Google Form quiz on digital literacy with different types of questions. Making the form was easy, but deciding good questions took some time. I shared the form and added screenshots as proof. This task showed me how useful tools like HackerRank and Google Forms are for learning and sharing knowledge. It also made me realize that regular practice is important to improve coding skills. This also improved my confidence in solving problems independently.

Task 4 – Professional Email & Etiquette Guide

In Task 4, I learned about a situation where communication was not clearly understood. It made me realize that communication is not just about sending a message but also about how the other person understands it. Sometimes we think we are clear, but the other person may get confused. This made me understand the importance of simple and clear communication. I also learned that checking with the other person is important to avoid misunderstandings. This is especially useful in online communication like emails and messages. This task helped me understand that good communication is an important part of digital literacy.

Task 5 – Cybercrime Awareness Case Study & Prevention Guide

For Task 5, I researched UPI and online payment frauds and wrote a case study. I learned how scammers trick people by asking for OTPs, sending fake links, or pretending to be bank officials. What surprised me the most was how easily people can get scammed with small mistakes. I created a “Stay Safe Online” checklist with 8 safety tips, including being careful during online payments. I also added reporting options like the National Cyber Crime Portal and helpline 1930. While researching, I realized that I also need to be more careful while making digital payments. One habit I will change is double-checking links and payment details before proceeding. This task taught me that awareness is very important to stay safe online, and even basic precautions can prevent serious problems.

Conclusion

This project helped me understand that digital literacy is not just about using technology but using it in a safe and responsible way. I learned how to create an infographic, practice coding, build professional profiles, and understand cyber safety. Each task taught me something new and useful. I also became more confident in using digital tools and sharing information. This project made me realize that having a good online presence and being aware of risks is very important for students. Overall, it was a useful learning experience, and I will continue to apply these skills in my studies and future work.
